Ready for the future!

Since 2004, together with our team, breeders, growers and business partners we have created a solid potato company marketing our varieties in 65 countries worldwide.

Our modern premises will enable us to grow further. We have modern lab facilities, more storage and office space.

TPC offers a unique and diverse selection variety portfolio with great growing solutions for our farmers and customers. For all market segments we have good solutions, i.e. retail, processing industry and the traditional export markets.

Our TPC breeding program delivers new potato varieties which add extra value for the complete TPC potato chain.

Water availability becomes a larger problem every year. The salinization of the groundwater is the reason why we do our saline trials. We need to know where we stand and what to advise to our partners. Another focus of our breeding program is to find resistant varieties to blight (*Phytophthora infestans*) and of course potato cyst nematodes (both *pallida* and *rostochensis*).

New techniques like gene editing, developing hybrid potato varieties and possible TPS (true potato seed) are entering the world of traditional breeding. TPC is prepared for the future and has done all the necessary to follow the developments and having access to the new developments as soon as we are allowed to use them worldwide. It is no longer the discussion if it will happen but only when. The current potato pests like *phytophthora*, new types of virus and/or bacterial diseases are coming up every day. We are improving the varieties to help the farmers worldwide feeding the world.

If we are ready for the future the TPC partners will be as well.

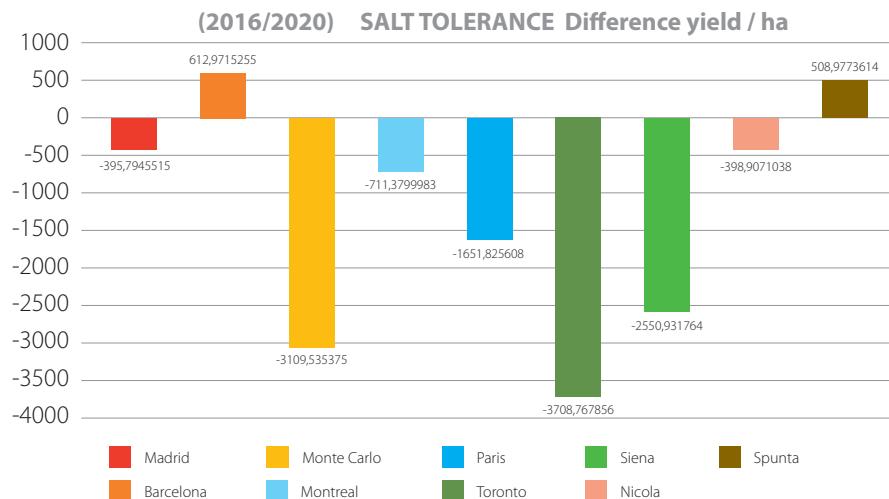

In the meantime we continue doing what we are good at: developing and marketing of: "**probably the best varieties in the world**"

Crop salt tolerance

In some specific areas where irrigation is needed to grow potatoes, the salinity levels go up year by year. This creates a problem because not all the existing varieties are tolerant to higher salinity levels of the water used for irrigation. If refreshing the soil is too expensive or not possible we need resistant varieties.

This is the reason why we have our saline trials in the middle east.

This enables us to advise our partners which TPC varieties they can grow with salty water.
This graph shows the loss in yield by irrigating with different saline levels.

PCN resistant varieties are the guarantee for the future

Many TPC varieties are known for resistance for the potato cyst nematode (PCN). Growers are allowed to grow seed potatoes, only if no PCN is found. By using PCN resistant varieties farmers are able to keep their soils clean.

TPC breeders were aware of the PCN problem and because of these new varieties, the severe EU regulations, PCN can be controlled.

The PCN varieties produce through the roots, a nematode attractant. But the resistance prevents the nematodes multiplying and the PCN population will decrease. Experts say that by using high resistant varieties the nematode population will be killed and decrease with up to 80%.

TPC license partners

In countries where we are not able to export our seed due to import regulations, we are marketing our varieties with a license agreement. In this way everybody will take advantage of our great varieties, everywhere worldwide! We provide you with the genetics and help you with the registration and marketing. In this way we are able to market TPC varieties worldwide.

TPC sustainable

By growing seed potatoes with our partners, we are a very sustainable company. We do as much as we can. Our company cars are EV, we are self-sufficient generating solar energy for our cars and premises. We are growing and breeding organic TPC varieties and do all we can to improve our environment.

Barcelona

Kruising / cross

Mondial x Felsina

Algemene eigenschappen / general description

| | |
|---------------------------------------|---|
| Marktsegment / market segment | Mondial, Fabula, Spunta |
| Vroegrijpheid / maturity | Middenvroeg / middle early |
| Loofontwikkeling / foliage | Goed / good |
| Schilkleur / skin colour | Lichtgeel / light yellow |
| Vleeskleur / flesh colour | Lichtgeel / light yellow |
| Knolvorm / tuber shape | Lang oval / long oval |
| Diepte van de ogen / eye depth | Vlak / shallow |
| Grootte van de knollen / tuber size | Zeer groot tot groot / big to very big sized tubers |
| Drogestofgehalte / dry matter content | 19,50 % |
| Opbrengst / yield | Hoog / high |
| Geschikt voor / destination | Tafelaardappel / table - local market |
